Professional summary

I have over eight years of experience in web products and e-commerce. My work combines full-stack development with building AI applications. I develop agents and integrate models into business systems, evaluating response quality, token usage, and response time. I work with React, TypeScript, and Node.js and take projects from technical planning through deployment.

Professional experience

Performa.AI

2018 - present

Senior full-stack developer and go-to engineer at Performa.AI, an intelligence and conversion platform for e-commerce. I define architecture for projects, apps, and tools, clarify scope with product teams, and handle development, testing, and deployment, including APIs, integrations, and interfaces such as the dashboard.

- E-commerce frontend: during my first three years at Performa, I implemented product display rendering, placement, and styling, matching native storefront designs pixel for pixel. I also built custom displays from PSD files and Figma designs, custom search interfaces, and frequently bought together product displays.
- Delivery capacity: I integrated three stores per day, compared with the previous baseline of one, reaching five on days with overtime. I reused structures and styles, reviewed native components and insertion points before coding, and organized implementation into placement, rendering, styling, and behavior checks. Familiarity with themes and recurring issues reduced investigation time and rework. During one period, I handled the workload previously covered by three developers on my own.
- Shopify: I developed three complete apps using Liquid and Remix. The apps did not reach production due to internal company issues.
- AI-assisted development: I have used AI agents at work for 1.5 years. I use Codex connected to the Performa MCP server to implement and adjust e-commerce integrations, review the code, run local checks, and verify changes through API readbacks. Store validation includes manual testing.
- Email marketing: I created HTML and MJML email templates for marketing campaigns.
- Reliable order processing: I implemented idempotent webhook processing to prevent duplicate records in a service with more than 150 connected clients and thousands of requests per minute, keeping data consistent for recommendation evaluation.
- E-commerce integrations: I developed and maintained catalog and order synchronization with Shopify, Nuvemshop, Loja Integrada, Tray, VTEX, and Magazord, respecting API limits and automating updates to reduce manual intervention.
- APIs and security: an API backed by replicated MongoDB with JWT, HMAC, and rate limiting, handling thousands of requests per day.
- Dashboard and interfaces: I built interfaces connected to the backend and integrations, translating product requirements into operational tools.
- Platform partnerships: technical discussions to obtain integration guidance and support partnership agreements.
- Support and clients: assistance to the support team, client-specific implementations, and resolution of complex technical issues.
- Mentoring: helping early-career professionals with day-to-day technical questions and decisions.
- Architecture and scale from the initial implementation: I plan projects, apps, and tools for efficiency and growth within their scope, taking responsibility for technical decisions, development, testing, and deployment.

- AI agents: I helped build a support agent using RAG and owned the backend, WebSocket connections, validation, and conversation flows. The solution started on WhatsApp with Baileys and evolved into a storefront chat connected to the product catalog, recommending products based on shopping intent.
- AI cost and response quality: I adjusted input context, model selection, and reasoning effort for each request. I worked with prompt caching, removed unnecessary API calls, and validated inputs to reduce prompt injection risk. I evaluated token usage, response time, and answer relevance through tests and the tool dashboard.

Freelance Full-Stack Developer 2017 - present

My freelance experience includes websites, web platforms, corporate intranets, scheduling systems, and email marketing automations. I work from requirements gathering through production delivery, covering frontend, backend, integrations, and maintenance.

- Corporate intranet: an internal communication system with a photo archive and a noticeboard.
- Email marketing: a sending queue built with BullMQ, Node.js, and Amazon SES, deployed to a DigitalOcean VPS.
- Dental clinic: an appointment scheduling system for managing dentists, staff, and available time slots.
- JSBJJ Kylemore: complete interface and platform development, with student acquisition, registration, authentication, recurring payments via GoCardless, and PostgreSQL with Prisma ORM.
- Unit 5: complete website design and responsive frontend implementation, with service information, social proof, and calls to action encouraging visitors to get in touch.
