Professional summary

I have over eight years of experience in web products and e-commerce. My work combines full-stack development with building AI applications. I develop agents and integrate models into business systems, evaluating response quality, token usage, and response time. I work with Next.js, TypeScript, and Node.js and take projects from technical planning through deployment.

Professional experience

Performa.AI

2018 - present

Senior full-stack developer and go-to engineer at Performa.AI, an intelligence and conversion platform for e-commerce. I define architecture, agree on scope with product teams, and handle development, testing, and deployment.

- E-commerce frontend and delivery: for three years, I built custom product displays and search interfaces based on storefront designs, PSD files, and Figma layouts. I increased delivery from one to three stores per day by reusing structures and styles.
- Integrations and scale: I built catalog and order synchronization with six e-commerce platforms. I implemented idempotent webhooks to prevent duplicates in a service with over 150 clients and thousands of requests per minute.
- APIs and dashboard: I built services using replicated MongoDB, JWT, HMAC, and rate limiting, alongside operational interfaces connected to the backend and integrations.
- AI product: I owned the backend, WebSockets, and conversation flows of a RAG agent, from WhatsApp to storefront chat with catalog recommendations. I tuned context, model selection, and prompt caching, evaluating token usage, response time, and relevance.
- AI-assisted development: I use Codex connected to the Performa MCP server to implement integrations, review code, run local checks, and verify changes through API readbacks.

Freelance Full-Stack Developer

2017 - present

My freelance experience includes websites, web platforms, corporate intranets, scheduling systems, and email marketing automations. I work from requirements gathering through production delivery, covering frontend, backend, integrations, and maintenance.

- Corporate intranet: an internal communication system with a photo archive and a noticeboard.
- Email marketing: a sending queue built with BullMQ, Node.js, and Amazon SES, deployed to a DigitalOcean VPS.
- Dental clinic: an appointment scheduling system for managing dentists, staff, and available time slots.
- JSBJJ Kylemore: complete interface and platform development, with student acquisition, registration, authentication, recurring payments via GoCardless, and PostgreSQL with Prisma ORM.
- Unit 5: complete website design and responsive frontend implementation, with service information, social proof, and calls to action encouraging visitors to get in touch.
